

GML Antennae Setup for Multiple Modems in one Box

WRONG

Antennae near each other in the same box. Signal from one modem interferes with the other modem

CORRECT

Antenna facing DOWNWARDS mounted DIRECTLY BELOW the UPWARDS facing antenna
If more than 500 mm spacing can be achieved, better performance will be achieved

Both antennae should be mounted on brackets spaced at least 300 mm from the mast, away from the box using extension cables, the shorter the better

NOTE - One antenna must face up, the other down at the recommended separation and alignment. This will minimise the signal from one antenna interfering with the other
